

POST-FIRE REFORESTATION

Replant Smart

- Discuss a reforestation plan with your local forestry division district office
- Prioritize soil stabilization first - you can plant native grasses/shrubs before tree seedlings
- Use caution with outside companies, lean on your district forester for regionally appropriate reforestation planning

Match Seed Source to Planting Site

- Invest in trees that will survive for 100 years or more
- It is important to plant the right trees in the right place
- Don't put seed sources on the landscape that don't belong

Not Enough Seedlings This Year

- Seed source is critical to the survival of seedlings used for reforestation purposes. Seed source influences the ability of seedlings to withstand future stressors such as insects, disease, drought, and warmer climates. Whenever possible, local ecotypes/genotypes should be utilized for reforestation purposes.
- There is a shortage of suitable reforestation seedling providers in the Southwest.
- Support the New Mexico Reforestation Center so our state has infrastructure and capacity to grow more seedlings!
